

## Give your experts more time to do expert work

ROI executive brief · Released September 9, 2026

Published studies show that suitable AI-assisted and electronic data workflows can accelerate selected tasks. Qevatrix applies that mechanism to repetitive work while keeping qualified people responsible for approvals and regulated decisions.

### Eight released applications

| Application   | Where capacity is released                                                                                                |
|---------------|---------------------------------------------------------------------------------------------------------------------------|
| QualityOS     | Replaces disconnected trackers and repeated audit-evidence assembly with controlled workflows and live records.           |
| RegulatoryOS  | Surfaces renewal and filing deadlines and reuses controlled device information in dossiers and assessments.               |
| DeviceOS      | Avoids re-keying across quality and regulatory work and saves \$9,540 per year versus both Professional plans separately. |
| ClinicalOS    | Runs clinical data and operations on one record set instead of reconciling separate systems and exports.                  |
| EvidenceOS    | Uses configurable specialty packs instead of a bespoke registry build and reuses governed data for evidence outputs.      |
| StudyOS       | Automates missing-data, imaging and document follow-up so clinical teams spend less time chasing status.                  |
| DistributorOS | Captures case usage once for billing, replenishment and commissions while surfacing readiness and inventory exceptions.   |
| TrademarkOS   | Structures searches, rationale and deadline tracking instead of rebuilding the same work across files and calendars.      |

### Transparent model

| Scenario         | Reduction | Use                                                                       |
|------------------|-----------|---------------------------------------------------------------------------|
| Conservative     | 15%       | Below every published AI productivity result cited here.                  |
| Base case        | 25%       | Close to the 25.1% speed gain observed in the 2026 consulting experiment. |
| High utilisation | 35%       | Mature adoption across several connected Qevatrix applications.           |

### Base-case examples

| Configuration                        | Hours released | Capacity value | Modelled ROI |
|--------------------------------------|----------------|----------------|--------------|
| QualityOS Essentials · small team    | 240/year       | \$14,400       | 21%          |
| DeviceOS Professional · growth-stage | 720/year       | \$54,000       | 50%          |

### Important

Figures are illustrative scenarios, not observed customer outcomes. Recovered time is capacity, not payroll savings. Pricing is current as of September 9, 2026. DistributorOS is standalone; ClinicalOS, EvidenceOS and StudyOS are connected. Qevatrix does not guarantee compliance, savings, revenue or regulatory outcomes.
